Allowable Subject Matter

1. Claims 1-28 are allowed.
2. The following is an examiner's statement of reasons for allowance: The claimed method for improving the performance of a rotary actuator (VCM) that has a recorded series of command signals which while the actuator is moving stores adjusted command effort signals, monitors the velocity, calculates acceleration based on the velocity and the stored command effort signals and then adjusts the acceleration value to account for radial torque parameter variation is neither taught by nor an obvious variation of the art of record.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Codilian et al. ('787) having the same assignee as the present invention, similar to the claimed invention but does not teach a method that takes into account radial torque as exemplified by figure 4 and as set forth by the claimed invention.

Green et al. cited by applicant teaches to shorten access time by switching current direction based on distance to go to a target track.

Art Unit: 2651

Codilian et al. ('558) teaches to use multiple iterations of seek to estimate saturation acceleration.

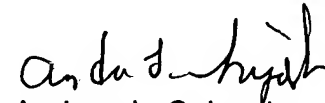

Anderson et al. teaches to scale deceleration trajectory to compensate for decrease of torque constant of the actuator motor.

Clare et al. teaches an improved modeling in a saturated seek mode.
